DETAILED ACTION

Election/Restrictions

Applicant's election without traverse of Group I, Species le (claims 1 and 6-17) in Paper No. 6 is acknowledged.

Claim Objections

Claim 9 is objected to because of the following informalities: In claim 9, line 2 the term "relatively" is indefinite because it is unclear as to what constitutes a "relatively high diffusion rate". Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 6-9, 11 and 17 are rejected under 35 U.S.C. 102(b) as being anticipated by Ecer (5,812,925). Ecer teaches positioning the components relative to one another to obtain a desired orientation; and bonding the two components in the desired orientation with metal wherein a temperature of both components is maintained below a melting temperature of the metal while bonding (abstract; column 2, line 48-column 3, line 21; column 3, line 57-column 4, line 5; column 5, lines 7-18; column 5,

Application/Control Number: 10/017,350 Page 3

Art Unit: 1725

line 51-column 6, line 12; and claims 1 and 8). Diffusion bonding is a solid-state process in which the layers do not melt. Since the particle layer of Ecer does not melt, the temperature of both components is maintained below the melting temperature of the metal. If the temperature of the components exceeded the melting temperature of the metal, the metal would inherently melt. Ecer also teaches providing particles of the metal on the two components and bonding the metal particles (abstract; column 2, line 48-column 3, line 21; column 3, line 57-column 4, line 5; column 5, lines 7-18; column 5, line 51-column 6, line 12; and claims 1 and 8); each of the particles of the metal comprises a dielectric material coated with the metal (column 5, lines 51-64); allowing diffusion between the metal particles (abstract; column 2, line 48-column 3, line 21; column 3, line 57-column 4, line 5; column 5, lines 7-18; column 5, line 51-column 6, line 12; and claims 1 and 8); providing the particles of the metal with a dielectric coating thereon and wherein bonding the metal particles is preceded by rupturing the dielectric coatings; and providing the particles of the metal with a diffusion barrier thereon and wherein bonding the metal particles is preceded by rupturing the diffusion barrier (column 5, lines 51-64). Oxides have been defined as being a dielectric and a barrier layer in the applicant's disclosure. In addition, the Examiner's considers the materials of Ecer to have a high diffusion rate at room temperature.

Allowable Subject Matter

Application/Control Number: 10/017,350

Art Unit: 1725

Claims 10 and 12-16 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is an examiner's statement of reasons for allowance: The prior art of record does not teach either alone or in combination a method of bonding two components as recited by claim 10, particularly bonding the two components in the desired orientation with Indium metal wherein the temperature of both components is maintained below the melting temperature of the metal while bonding; or a method of bonding two components as recited by claim 12, particularly rupturing the dielectric coatings by passing the electric current through the particles; or a method of bonding two components as recited by claim 13, particularly, the metal comprises the first metal with the first rate of diffusion and wherein the particles comprise the coating of the second metal with the second rate of diffusion wherein the second rate of diffusion is lower than the first rate of diffusion; or a method of bonding two components as recited by claim 14, particularly the first metal comprises Indium and the second metal comprises Copper, wherein the temperature of both components is maintained below the melting temperature of the metal while bonding; or a method of bonding two components as recited by claim 15, particularly providing the particles of the metal with the coating of the solid material that sublimes at the bonding temperature less than the melting temperature of the metal; or a method of bonding two components as recited by claim 16, particularly the solid material comprises one of naphthalene or carbon dioxide.

Any comments considered necessary by applicant must be submitted no later

than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on

Statement of Reasons for Allowance."

Conclusion

The prior art of record that is cited as of interest is presented on the form-892.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Kiley Stoner whose telephone number is (703) 305-

0723. The examiner can normally be reached on Monday-Thursday (7:30 a.m. to 6:00

p.m.).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Tom Dunn can be reached on Monday-Friday. The fax phone numbers for

the organization where this application or proceeding is assigned are (703) 872-9310 for

regular communications and (703) 872-9311 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or

proceeding should be directed to the receptionist whose telephone number is (703) 308-

0661.
